Tiny Ramous Wood

Availability: Out Of Stock
Call for Price: 011 826 5887

Description

The Tiny Ramous Woods are the ends of the branches of Osteomeles Anthyllidifolia, characterized by a very high branching rate and a particularly reduced diameter that allow to recreate extraordinarily suggestive sceneries with the anchoring, for example, of Riccardia or Ricca Fluitans mosses (yes would give life to real submerged forests).

They are particularly light woods which may require the use of sinking supports (eg small rocks or slate slabs.

May not always bw available in stock.as stock levels will vary depending on depend and availability.
