Availability: 4

Price: R270.00

Short Description
Mount coral frags and colonies to reef rock and plugs Bonds within seconds even underwater. New formula is 17x thicker allowing for more control and less mess.

Description
Seachem Reef Glue is a superior cyanoacrylate gel for gluing and mounting coral frags and colonies to reef rock or plugs. It bonds within seconds and has excellent control, hold and durability characteristics. It can even be used underwater. Seachem Reef Glue can be used for any aquascaping in freshwater or saltwater aquariums or for any plastics repairs. Seachem Reef Glue comes in an aluminum tube for extended stability beyond products contained in plastic bottles - it won't dry up in the tube.

With a new formula that is 17x thicker, there’s more control while gluing and less mess in application.

Directions

Dispense a small amount of glue prior to each use. Apply a small amount of Seachem Reef Glue to one of the surfaces and press parts together for 20 seconds. Wipe tip free of glue before replacing the cap
