

Flourite

Call for Price: 011 826 5887

Short Description

Premium natural substrate for the planted aquarium Good for the life of the aquarium
Rinse right in the bag (3.5 kg only)

Description

Flourite® is a specially fractured stable porous clay gravel for the natural planted aquarium. Its appearance is best suited to planted aquaria, but may be used in any freshwater aquarium environment. Flourite® is most effective when used alone as an integral substrate bed, but it may be mixed with other gravels. Gravel modifiers such as laterite are not necessary. Flourite® is not chemically coated or treated and will not alter the pH of the water. Flourite® is good for the life of the aquarium and need not be replaced.
