Short Description

Premium natural gravel for the planted aquarium Good for the life of the aquarium Rinse right in the bag (3.5 kg only)

Description

Flourite® Red is a specially fracted stable porous clay gravel for the natural planted aquarium. Its appearance is best suited to planted aquaria, but may be used in any freshwater aquarium environment. Flourite® Red is most effective when used alone as an integral substrate bed, but it may be mixed with other gravels. Gravel modifiers such as laterite are not necessary. Flourite® Red is not chemically coated or treated and will not alter the pH of the water. Flourite® Red is good for the life of the aquarium and need not be replaced.

To determine the number of bags required for your aquarium, please note that each bag (7 kg, 15.4 lbs) occupies a volume of approximately 7,000 cm^3 (425 cu. in.). To determine your desired volume multiply tank width by length by desired depth. This bag is sufficient for about a 5 cm (2 inch) deep bed in a typical 40 L (10 gallon) tank.
