Seachem KanaPlex 5g

Availability: 2

Price: R260.00

Short Description
road Spectrum Antibiotic Treats fungal and bacterial fish diseases Easily absorbed through both skin and gills; ingestion not required.

Description
Seachem KanaPlex is a blended kanamycin based medication that safely and effectively treats several fungal, and bacterial fish diseases (dropsy, popeye, fin/tail rot, septicemia). Because it is absorbed by fish it is useful in treating internal infections in those situations where food is refused. It does not adversely affect the filter bed and is easily removed with carbon. When used in a medicated food mix, it is excellent for treating bacterial infections in tanks that contain invertebrates. For use in freshwater or marine aquariums.

Common Fish Diseases Treatable with KanaPlex - Popeye & Bacterial infections.

(Popeye is caused by a buildup of fluid behind the eye and is often seen in conjunction with Dropsy.)

Types of Infections Treated with Seachem KanaPlex - Fungal & Bacterial.
