Seachem MetroPlex 5g

Availability: 2

Price: R260.00

Short Description
Treats protozoan parasites and anaerobic bacterial diseases Little danger of overdose No impact on bio-filter Well suited for medicated food mix for internal parasites.

Description
Seachem MetroPlex is an effective and safe treatment for several protozoan and anaerobic bacterial diseases of fish (Cryptocaryon, Hexamita, Ichthyophthirius). It does not adversely affect the filter bed and is easily removed with carbon. It can either be dosed into the water or combined with Seachem Focus in a medicated food mix. It will treat both internal and external infections regardless of the delivery method. When used in a medicated food mix, it is excellent for treating parasites in tanks that contain invertebrates. MetroPlex is gentle and there little danger of overdosing.

Common Fish Diseases Treatable with MetroPlex - Ich (White Spot), Ichthyophthirius (freshwater) / Cryptocaryon (saltwater).

Ich looks like salt sprinkled on the fish’s body and fins. Usually accompanied by twitching, flashing, and other signs of stress and irritation. Several parasites are grouped under this name, but the symptoms are almost identical. Ich is among the most common infections of fish, and is entirely treatable with diligence and attention to water quality.

Velvet is similar to Ich, but smaller and grey-gold. Most often seen in saltwater, but can

occur in freshwater as well. Velvet is less common than Ich, but the treatment is almost identical.

Types of Infections Treated with Seachem MetroPlex - Parasitic & Viral.
