Short Description
A mineral soil designed to facilitate the spawning of shrimps.

Description
AquaShrimp Powder Informations

Enriched soil especially designed for shrimp

The powder texture of AquaShrimp Powder will allow shrimp to lay juvenile shrimp and keep them at the surface of the substrate.

AquaShrimp Powder is porous enough to allow nitrifying bacteria to properly colonize the substrate and improve water quality

High temperature treatment (around 1200°C; 2192°F) gives its physical properties and allows it to be free of parasitic species which could contaminate the aquarium

AquaShrimp Powder is tested by an independent laboratory (microbiological, chemical, and radioactive tests)
