

Ceramic Rings (Biological Filter Media) 1kg

Price: R125.00

Short Description

Sold per kg

Description

Ceramic rings have long been used as filter medium in domestic aquariums. The pores in the ceramic rings help and encourage the build-up of useful bacteria.

This in turn converts harmful substances, like ammonia, to enhance the quality of the aquarium water. The ceramic rings can be used with all types of filtration system. They can be used together with other filters such as sponge and activated carbons.

Ceramic rings helps to protect against nitrates and ammonia and creates the ideal environment for the growth of beneficial bacteria colonies. The highly porous and hollow ceramic rings effectively increase the flow of water and distribution of oxygen.

Ceramic rings are the best filter media for ensuring the growth of nitrobacteria, optimisation of the filtering process and cleaning and deodorising of your fish tank. Ceramic rings are great for use in a freshwater or saltwater.
