Price: R1,079.00

Short Description

Easy to Use. Six Essential Tests for Freshwater Aquariums. Accurate Liquid Drop Tests for Reliable Results - Much More Accurate Than Water Test Strips. Includes a Water Quality Guide, Colour Charts, and an Integrated Test Tube Rack. Up to 200 Tests (combined).

Description

The main factor in successful fish keeping and health lies in the maintenance of good water quality. Ammonia, nitrite and pH levels in the aquarium should be checked regularly. The Aquarium Lab Multi-Test Kit comprises up to 200 tests combined of the 6 key parameters to test in your aquarium: ammonia, nitrite, nitrate, pH, GH and KH. All the tests are liquid drop tests from a dropper bottle so all the drops are the same size. Full instructions are included detailing optimum levels and suggestions for correction, along with an integrated test tube rack. All you have to do is add your aquarium water to the test tube and count the drops needed. The back of the box details clear pictorial instructions so you can see what to do from the start. A set of colour coded stickers is provided to label both the test tubes and test tube lids so you always conduct the same test in the same test tube avoiding contamination.

Designed in the UK, NTLABS kits are trusted for their precision and reliability. Ideal for tropical and coldwater aquariums, it comes with clear instructions and all necessary reagents and accessories for multiple tests.
