Description
The Electric Blue Jack Dempsey is a naturally occurring color-morph of the Jack Dempsey which has often been bred in captivity.

The Electric Blue Jack Dempsey is an easy fish to care for and a great Cichlid starter fish for beginners. They are not overly demanding when it comes to water conditions and will take a variety of commercially prepared foods.

Since they are omnivorous, the Electric Blue Jack Dempsey will generally eat all kinds of live, fresh, and flake or pelleted foods. They get quite large so they should be fed a high quality pelleted food and large chunk foods such as meat or fish.

The Electric Blue Jack Dempsey is a freshwater fish that originates in the murky warm waters of Central America. It has a base color of electric blue to gray, and displays many iridescent blue and green spots, giving this fish a spectacular look. When breeding, these colors will intensify.
