

Hygrophila Pinnatifida

Call for Price: 011 826 5887

Description

Hygrophila pinnatifida originates from India. It obtains brown, patched leaves on the surface with a distinctive burgundy colour underneath. It forms multiple horizontal shoots if the top shoots are pinched. This will maintain compact and attractive growth. The horizontal side shoots easily attach to both wood and rocks. Growth is moderate, stems 15-40 cm tall and 10-20 cm wide, and the colour is attractive when planted in small groups with a plain background. Intense lighting ensures compact growth due to the plant's slow to medium growth rate.
