

Leporinus

Call for Price: 011 826 5887

Description

The black banded leporinus has the appearance of a torpedo-shaped bumblebee. Its thick, vertical black and yellow stripes help individuals blend into the school in wide-open water much like zebra camouflage together on the open plains. Please note that they can be extremely aggressive. They are found in Central South America in Amazon tributaries from Guianas to the La Plata.

The Leporinus fish is a striking freshwater species known for its bold black and yellow vertical stripes and active nature. Native to the Amazon River Basin and other South American waterways.

*Origin - South America

*Max Size- 30-35cm

*Diet - Omnivorous – enjoys flakes, pellets, fresh vegetables, and occasional protein-based treats
