Hygrophila Difformis (Water Wisteria)

Availability: 10

Price: R50.00

Description

Hygrophila difformis, commonly known as water wisteria, is an aquatic plant in the acanthus family. It is found in marshy habitats on the Indian subcontinent in Bangladesh, Bhutan, India and Nepal.

Hygrophila difformis from Asia is beautiful and undemanding stem plant.

Stems becomes 20-30 cm tall and 6-12 cm wide. A plant for beginners, which will help create balance in the aquarium from the start. Its rapid growth helps prevent algae because the plant absorbs a great number of nutrients from the water. The shortage of micronutrients leads to pale leaves, which may be an indication that the aquarium needs fertiliser.

In large aquariums its lobed leaves can create a distinctive group.
